### Pension target forecast instructions

The target forecaster enables you to model the level of increased contribution you would need to make in order to achieve a specific level of retirement income at your desired retirement age.

Please remember that if you model a retirement age which is earlier than the normal retirement date of any final salary pension schemes in your portfolio, then these will not be taken into account, as it is assumed that these schemes only become payable at their normal retirement date.

To understand the key assumptions used in making this forecast please [click here](#).

### Pension target forecast

Details	Current	Projected
